AB - PROBLEM TO BE SOLVED: To always secure the use of a common text
by acquiring the particular contents of each displayed Web page
within an application frame.

SOLUTION: An application interface frame 220 of a Web page
window 110 includes an application banner 222, an application
navigation bar frame 230, an application frame 224 and a
background 225. The frame 224 is used to display the particular
contents of a specific page that is being read. As the banner
222 and the frame 230 are always included in the frame 220, a
Web page designer is not required to include the navigation
link or banner header information in the particular contents of
a Web page itself. Then the particular contents of the Web page
are entirely displayed on the frame 224.
